Data Visualization & Analytics Lab

Experiment No. : 10

Design and implement
a comprehensive dashboard
Integrating various visualizations

Experiment No.10

1. **Aim:** Design and implement a comprehensive dashboard integrating various visualizations (bar charts, scatter plots, heatmaps, sparklines) for business intelligence, considering design best practices and visual perception principles.
2. **Objectives:**
   - Understand the components involved in visualization design.
   - Understand the type of data impacts the type of visualization.
3. **Course Outcomes**: Students will be able to Apply visual principles and best practices for designing clear, user-focused dashboards.
4. **Hardware / Software Required:** -Tableau/PowerBI
5. **Theory:**

   Students need to identify any real world use case of business intelligence and design a comprehensive dashboard integrating various visualizations (bar charts, scatter plots, heatmaps, sparklines) for the same.

   Considering the best design practices and visual perception principles.
6. **Conclusion:**

   Based on your study and understanding of the chosen case study, write the conclusion.
